APPENDIX C: SUMMARY INDICATORS OF ECONOMIC IMBALANCES

As previously highlighted IFAC (2015b), the Council, as part of its toolkit for examining the cyclical position of the economy use a modular approach. While univariate filters and other potential output measures are useful, there is a danger that they may not reflect all available economic information which may point to possible imbalances in the economy. Specifically in response to the financial crisis, Borio et al (2014) developed methods of estimating potential output using financial indicators, which capture the effect of the financial sector on the business cycle. This approach can be applied to other variables which may provide useful information on the cyclical position of the economy. With this in mind, this appendix shows some potential sources of imbalances. Within each module, a number of indicators are examined.

While this modular approach ensures that many potential sources of imbalance are examined, there are difficulties in choosing/estimating weights for each of these imbalance indicators. Historical data may be a good guide to variables that explain previous business cycles, but not necessarily current or future ones. Five modules are shown here, namely the labour market, the external sector, investment indicators, credit ratios/gaps and housing indicators.

B. UNEMPLOYMENT RATE AND BUILDING AND CONSTRUCTION AS % GDP

Source: CSO; Department of Finance projections & internal IFAC calculations.

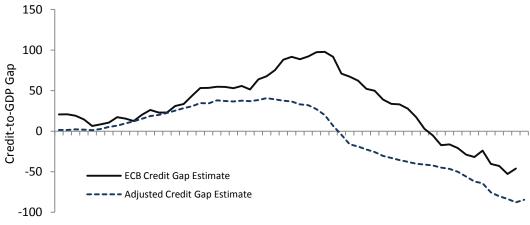

FIGURE C.4: ADDITIONAL CREDIT INDICATORS

Sources: Central Bank of Ireland; CSO; internal IFAC calculations.

Notes: The adjusted credit-to-GDP gap ratio is constructed as Irish resident private sector enterprise credit (ex fin. intermediation) plus total loan liabilities of Irish households. It is intended to adjust for the impact of multinational non-financial corporations on the aggregate ratio given that associated credit is often sourced outside of Ireland (for a similar approach, see Box 6: Macro-Financial Review 2015:I, Central Bank of Ireland). The ratio is calculated following a similar methodology to that in ESRB recommendation (18 June 2014) on guidance for setting counter-cyclical buffer rates (ESRB/2014/1). This specifies a credit ratio as: (CREDIT $_t$ / (GDP $_t$ + GDP $_{t-1}$ + GDP $_{t-2}$ + GDP $_{t-3}$)) × 100%.

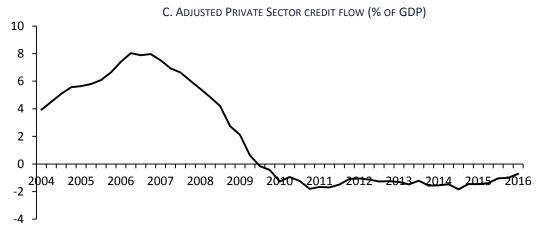

B. PRIVATE SECTOR CREDIT-TO-GDP GAPS

2002 2003 2004 2005 2006 2007 2008 2009 2010 2011 2012 2013 2014 2015

Sources: Central Bank of Ireland; CSO; ECB; internal IFAC calculations.

Notes: The adjusted credit gap is calculated following a similar methodology to that in ESRB recommendation (18 June 2014) on guidance for setting counter-cyclical buffer rates (ESRB/2014/1). For the underlying trend credit ratio, a recursive Hodrick-Prescott filtered trend ratio is specified, with smoothing parameter lambda = 400,000 to capture the long-term trend in the behaviour of the credit-to-GDP ratio. The credit-to-GDP gap is given by: $GAP_{t} = RATIO_{t} - TREND_{t}$.

Note: 4 Q moving average.
